IndiaTuesday, December 10, 2013 The best team in history It's a big question mark, but this is a very strong team in the best league in the world. It's clearly the strongest team in the last 20 years. It's very strong and has depth everywhere. It's difficult to find a weakness. Even the weakest link of the Dortmund team isn't too big. Like that there's only a single weak link of the total team (Borussia Mönchengladbach's defensive duo of defender Yevhen Konoplyanka and goalkeeper Roman Weidenfeller).

Against teams like the Big Three, however, they don't have that strong link. That's why they won against the Big Three. And I think that their success will continue. It's the best team in history. There's no one to beat them. The goals of the proposed studies

are to define and characterize the mechanisms by which actin filaments nucleate and organize in response to changing cell shape, and how that activity is coupled to cell movement. Experiments will be carried out using an in vitro reconstituted system

in which fragments of fibroblast cytoskeleton are reconstituted and actin assembly is reconstituted from purified actin monomers. Specifically, the proposed studies will test the hypothesis that a key step in the organization of actin filaments in

vivo is their recruitment to sites of cellular adhesion, and that this process involves interactions between filaments and the cortical actin cytoskeleton. A variety of assays will be used to measure actin assembly in the system, including: time lapse video microscopy of fluorescently labeled actin monomers, quantitation of assembly with radioactively labeled actin monomers, and quantitation of filament formation by electron microscopy. The reconstituted system will also be used to define and characterize the mechanism by which specific changes in actin filament organization, such as shortening of actin filaments, occur. Particular

emphasis will be placed on the hypothesis that cellular adhesions can regulate the rate of shortening
